At its core, Rock Paper Scissors is a zero-sum game. There are 3 possible outcomes for each round: a win, a loss, or a draw.

- **Rock** squashes Scissors.
- **Scissors** cuts Paper.
- **Paper** covers Rock.

When played delicately, the chances of winning any single round are strictly 33.33% (presuming random options). Nevertheless, when money is on the line, the characteristics shift. Online platforms and modern-day gambling variations normally structure bets in a couple of unique ways:

1. **Best-of-Series (Best of 3, 5, or 7):** Players position a wager on a multi-round match to minimize the influence of pure luck and reward consistency.
2. **Instant-Win Crypto Games:** Players play single rounds against a provably fair algorithm, choosing their weapon and receiving an instant payment if they win.
3. **Peer-to-Peer (P2P) Betting:** Platforms enable users to set a wager, lock their choice into a smart contract, and bet another human user from throughout the world.

Odds, Payouts, and House Edge

Bet Type Player Win Probability Typical Payout Implied House Edge **P2P Matches** ~ 33.33% (versus rational opponent) 1.90 x to 1.95 x total pot 2.5% to 5% (Platform Fee) **Casino vs. House (Best of 1)** 33.33% 2.0 x (Even Money) 0% (If genuinely fair, however rare) **Casino vs. House (Multi-round)** Variable Scaled based upon series length Differs by platform rules on ties

Note: In many peer-to-peer RPS gambling setups, your house takes a small rake (typically 2% to 5%) from the total pot as a service cost, which operates similarly to poker rake.

  - If a gamer **loses** a round, they are statistically most likely to move to the weapon that *beats* what just beat them.
