- **Scissors** (a fist with the index and middle fingers extended) cut Paper.
- **Paper** (a flat hand) covers Rock.

In a gambling setting, nevertheless, the stakes rise. Players position monetary wagers before each round. This can be structured in a couple of various methods:

- **The Reaction to Losses:** When a player loses a round, they hardly ever throw the exact same shape instantly. Rather, they typically switch to the shape that *would have beaten* their opponent's last gaining relocation.
- **The Reaction to Wins:** When gamers win a round, they typically have a cognitive bias that tells them to toss the winning shape again, or they shift to the shape that the opponent might expect them to prevent.
- **The Illusion of Control:** Players typically attempt to overcomplicate their decision-making, resulting in predictable sequences or loops.

- **The Nash Equilibrium Approach:** In game theory, the optimum unexploitable method is to toss Rock, Paper, and Scissors with **specific 33.3% randomness**. If you accomplish true randomness, your opponent can not gain an edge over you, though you will not gain an edge over them either.
- **Making use of the Novice:** If betting an amateur or casual gambler, search for the Rock predisposition. Open with Paper, as it beats Rock and provides you an instant analytical benefit.
- **Pattern Recognition (Shot-Tracking):** In longer gambling sessions, keep mental or physical notes of your opponent's sequences. Do they prefer Paper after a tie? Do they stubbornly throw Scissors 3 times in a row? Capitalize on these habits.
- **The "Aura" Bluff:** Physical presence matters in live gambling. Utilizing psychological intimidation, confident posturing, or spoken hints can fool an opponent into second-guessing their relocation at the last 2nd.
